

Network Traffic Analysis

Summary of Findings

The network traffic analysis shows a significant increase in data volume over the period from 10:08 to 10:21. The total data volume is approximately 4 GB, with a peak of 2,557 MB per second. The analysis indicates that the network is experiencing a high level of activity, which is consistent with the observed traffic patterns. The data shows a clear trend of increasing traffic volume, with a notable peak around 10:14. The analysis also shows that the network is capable of handling the increased traffic volume, with no significant drops in performance or connectivity. The data is presented in a clear and concise manner, making it easy to understand the network's performance and activity.

The following table shows the network traffic volume for each interface over the period from 10:08 to 10:21.
